useful New host-vector system comprising a host chromosome, and a vector, as a vaccine for immunizing a poultry, preferably chicken, against coccidiosis.

Example 13; Fig 39; 201pp; English.

The present invention describes a host-vector system comprising a host chromosome, and a vector. The host-vector system comprises: (a) a host chromosome comprising: (i) an activatible control sequence that is activatible by an inducer; (ii) a sequence that encodes a repressor, where the sequence is operably-linked to the activatible control sequence; and (iii) at least one essential gene that encodes a polypeptide that is necessary for synthesis of a rigid layer of a cell wall of a prokaryote, and where the essential gene is inactivated; and (b) a vector

```
promoter sequence, a site for insertion of a gene encoding a desired gene product and a polyadenylation sequence; (ii) a prokaryotic activator—
product and a polyadenylation sequence; (ii) a prokaryotic activator—
promoter sequence; (iii) at least one origin of replication (ori); (iv) a regulatable prokaryotic promoter, which is repressible by the repressor; (v) at least one essential gene that is necessary for synthesis of a right layer of a cell wall of a prokaryote; (vi) at least one continuator sequence; and (vi) at least one CpG sequence motif that enhances immunogenicity. Also described: (1) a microorganism comprising the host vector system; (2) a vaccine comprising the comprising the host vector system; (2) a vaccine comprising the continuation a evidence of a cellivery of a nucleic acid vector and/or a desired gene product to a evidency of a nucleic acid vector and/or a minimizing a poultry against coccidiosis. The host vector system has immunising a poultry against coccidiosis. The present sequence represents a nucleotide sequence which is used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                         CTCGAGTCTAGAGGGCCCGTTTAAAACCCGCTGATCAGCCTCGACTGTGCCTTCTAGTTGC 185

The present is that of IL-2tm2, a fusion gene comprising a human interleukin-2 (IL-2) gene joined to DNA encoding the transmembrane domain of Fc epsilon-gamma. IL-2tm2 is an example of a novel fusion gene of the invention for use in cancer gene therapy that comprises a cytokine gene and a transmembrane domain gene. It is derived from IL-2tm ADS74208 by removal of a FLAG sequence and extraneous amino acids, and was expressed from vector poDNA3.1(+/-). The fusion protein is expressed as a membrane-bound cytokine which may be displayed on the surface of mammalian tumour cells. It is believed that by inducing expression of IL-2 on the surface of tumour cells, IL-2 will activate tumour-infiltrating lymphocytes in circase activation of antigen-specific T cells and hence to result in destruction of tumour cells expressing those antigens. Murine spinale cell skin cancer RD995 cells transfected with IL-2tm fusion gene or CMV2b (empty expression vector) were implanted subcutaneously into CHMSO Gene proximity to tumour growth compared with IL-2tm fusion gene or call fusion gene showed reduced tumour growth compared with controls.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The present invention describes isolated human NOVX proteins, where X is

1 to 42. ACC62236 to ACC62345 encode the human NOVX proteins given in
ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant,
hypotensive, dermatological, anoretic, antiatherosclerotic, cardiant,
antidabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV,
antidathmatic, metabolic, immunomodulator, neuroprotective, nootropic,
antidathmatic, metabolic, immunomodulator, neuroprotective, nootropic,
antidathmatic, metabolic, immunomodulator, neuroprotective, nootropic,
antiparkinsonian and antilipaemic activities, and can be used in gene
therapy. NOVX proteins are useful for treating or preventing a pathology
associated with the human disease. NOVX nucleic acides, proteins and
antibodies can be used in the treatment and diagnosis of cardiamyopathy,
atherosclerosis, hypertension, congenital heart defects, aortic stenosis,
antibodies can be used in the treatment and diagnosis of cardiamyopathy
atherosclerosis, hypertension, congenital heart defects, aortic stenosis,
antibodies and hyperplasia, prostate cancer, diabetes, metabolic
disorders, neoplasm, lymphoma, uterus cancer, fertility, haemophilia,
hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host
infectious disease, anorexia, cancer, associated cachexia, cancer,
alsease, AlDS, bronchial asthma, Crohn's disease, multiple sclerosis,
infectious disease, anorexia, cancer-associated cachexia, cancer,
Alzheimer's disease, parkinson's disease, immune disorders,
haematopoietic disease, parkinson's disease, immune disorders,
haematopoietic discases anorexes and probes for human NOVX
sequences, which are used in examples from the present invention.

                                                                                                                                                                                                                                                                                                                                                                            CTCGAGTCTAGAGGCCCGTTTAAACCCGCTGATCAGCCTCGACTGTGCCTTCTAGTTGC 1246
                                                                                                                                                                      The invention relates to a novel isolated NOV polypeptide. The polypeptide of the invention demonstrates cytostatic activity and may be used for determining the presence of, or predisposition to a disease associated with altered levels of expression of the polypeptide, including metabolic disorders, immune disorders, neurodegenerative disorders, circulatory diseases, haemopoietic disorders, wasting diseases and cancer. The polypeptide may also be utilised during gene therapy procedures, vaccine development and transgenic animal production. The current sequence is that of the human NOV DNA of the invention.
                                                                                                  New isolated NOVX polypeptide, useful for determining the presence of, or predisposition to a disease associated with altered levels of expression of the polypeptide, and for treating or preventing cancer.
                                                                                                                                                                                                                                                                                                                                                               1 CTCGAGTCTAGAGGGCCCGTTTAAACCCGGCTGATCAGCCTCGACTGTGCCTTCTAGTTGC 60

The nucleic acids and encoded polypeptides are useful in screening for compounds useful for treating conditions such as insulin resistance, obesity or diabetes. This

The invention relates to human NOVX polypeptides and the polynucleotides encoding them. The invention also relates to antibodies specific to the NOVX polypeptides. The polypeptides, polynucleotides and antibodies are useful for manufacturing a medicament for treating a syndrome associated with a human disease, such as a pathology associated with the NOVX polypeptide. The sequences are useful for diagnosing, treating or preventing a NOVX-associated disorder, e.g., cancer, atheroscierosis, diabetes, Alzheimer's disease, Parkinson's disease, graft-versus-host disease, scleroderma, hypertension, haemophilia, idiopathic thrombocytopenic purpura, immunodeficiencies, AIDS, dyslipidemia, obesity, Crohn's disease, bronchial asthma, anorexia, cancer-associated cachexia, multiple sclerosis or fertility. The nucleic acids may be used as hybridisation probes, in chromosome mapping, in tissue typing, in preventive medicine or in pharmacogenomics. This sequence represents a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1187 CTCGAGTCTAGAGGGCCCGTTTAAACCGGCTGATCAGCCTCGACTGTGCCTTTGTAGTTGC 1246

The present invention describes isolated human NOVX proteins, where X is

1 to 42. ACC62236 to ACC62345 encode the human NOVX proteins given in
ARS42167 to ABEA4276. NOVX sequences have antiatheroscelerotic, cardiant,
hypotensive, dermatological, anorectic, immunosuppressive, cytostatic,
antidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV,
antidiabetic, metabolic, immunomodulator, neuroprotective, notropic,
antidathisonian and antilipaemic activities, and can be used in gene
therapy. NOVX proteins are useful for treating or preventing a pathology
associated with the human disease. NOVX nucleic acids, proteins and
antibodies can be used in the treatment and diagnosis of cardiomyopathy,
atherosclerosis, hypertension, congenital heart defects, aortic stenosis,
congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic
congenital adrenal hyperplasia, prostate cancer, fertility, haemophilia,
congenital ion, idiopathic thrombocytopenic purpura, graft versus host
disease, AlDS, bronchial asthma, crohn's disease, multiple sclerosis,
infectious disease, anorexia, cancer-associated cachexia, cancer,
congenier's disease, Parkinson's disease, immune disorders,
conferences, which are used in examples from the present invention.

Alzheimer's disease, Parkinson's disease, immune disorders,
conferences, which are used in examples from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; NOVX; antiatherosclerotic; hypotensive; cardiant; dermatological; anorectic; immunosuppressive; cytostatic; antidiabetic; antinfertility; haemostatic; antinflammatory; antiasthmatic; anti-HIV; immunomodulator; neuroprotective; nootropic; antiparkinsonian; metabolic; antilipaemic; gene therapy; cardiomyopathy; atherosclerosis; hypertension; scleroderma; congenital heart defect; aortic stenosis; valve disease; transplantation; tuberous sclerosis; openital adrenal hyperplasis; diabetes; prostate cancer; metabolic disorder; neoplasm; lymphoma; uterus cancer; fertility; haemophilia; hypercoagulation; graft versus host disease; fidiopathic thrombocycopenic purpura; AIDS; bronchial asthma; anorexia; crohn's disease; multiple sclerosis; infectious disease; cancer; cancer; haematopoietic disorder; disease; parkinson's disease; multiple sclerosis; infectious disease; cancer; and the propositio disorder; dyslipidaemia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ARE 4277 represents a human trypsinogen protein given in comparison with
the human NOV35b protein in the exemplification of the present invention
Novel human proteins and nucleic acid encoding the proteins, useful for diagnosis, treatment and prevention of disorders involving the human protein or nucleic acid e.g. cardiac and neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 CTCGAGTCTAGAGGGCCCGTTTAAACCCGCTGATCAGCCTCGACTGTGCCTTCTAGTTGC

                                                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes isolated human NOVX proteins, where X is
1 to 42. ACG62236 to ACC62345 encode the human NOVX proteins given in
ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant,
hypotensive, dermatological, anorectic, immunosuppressive, cytostatic,
antidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV,
antisathmatic, metabolic, immunomodulator, neuroprotective, nootropic,
antipatkinsonian and antilipaemic activities, and can be used in gene
therapy. NOVX proteins are useful for treating or preventing a pathology
associated with the human disease. NOVX nucleic acids, proteins and
antibodies can be used in the treatment and diagnosis of cardiomyopathy,
athorocalerosis, hypertension, congenital heart defects, aortic stenosis,
valve disease, tuberous sclerosis, scleroderma, obesity, transplantation,
congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic
disorders, neoplasm, lymphoma, uterus cancer, fertility, haemophilia,
hyperparion, idiopathic thrombocytopenic purpura, graft versus host
disease, AlDS, bronchial asthma, crohw's disease, multiple sclerosis,
infectious disease, anorexia, cancer-associated cachexia, cancer,
Alzehimer's disease, Parkinson's disease, immune disorders,
harmonicalienticalison's disease, immune disorders,
harmonicalienticalison's disease, immune disorders,
harmonicalienticalisorders, dyslipidaemias, and probes for human NOVX
sequences, which are used in examples from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Alsobrook JP, Anderson DW, Berghs C, Boldog FL;

The invention relates to human NOVX polypeptides and the polynucleotides encoding them. The invention also relates to antibodies specific to the encoding them. The polypeptides, polynucleotides and antibodies are useful for manufacturing a medicament for treating a syndrome associated with a human disease, such as a pathology associated with the NOVX polypeptide. The sequences are useful for diagnosing, treating or preventing a NOVX-associated disorder, e.g., cancer, atheroscierosis, diabetes, Alzheimer's disease, Parkinson's disease, graft-versus-host disorder, an hypertenaton, hemophilia, idiopathic thrombocytopenic purpura, immunodeficiencies, AIDS, dyslipidemia, obesity, Crohn's disease, bronchial asthma, anorexia, cancer-associated cachexia, multiple sclerosis or fertility. The nucleic acids may be used a hybridisation probes, in chromosome mapping, in tissue typing, in preventive medicine or in pharmacogenomics. This sequence represents a human NOVX polynucleotide of the invention.

New isolated NOVX polypeptides and polynucleotides, useful for

```
The invention relates to novel isolated polypeptides, mature forms of these, or a sequence that is at least 95 % identical to, or having one or more conservative amino acid substitutions in the polypeptides. The material acid molecules and antibodies are useful in the polypeptides, nucleic acid molecules and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a manufacture of a medicament for treating a syndrome associated with a manufacture of a medicament for treating a syndrome associated with a molecules, polypeptides and antibodies are useful for treating.

CC preventing or diagnosing diseases such metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), neurodespenerative disorders, Alzheimer's disease, configuration of disorders, inflammatory skin disorders, asthma, and various dyslipidemias. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. meurogenesis, cell differentiation, cell proliferation, cell proliferation, cell proliferation, cententiation of antibodies that bind immunospecifically to NoVX substances for use in therapeutic or diagnostic methods. The nucleic acids are further used as hybridization probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. This sequence typing, preventive medicine, and pharmacogenomics. This sequence corresponds to the gene encoing one of the NoVX polypeptides of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1605 CTCGAGTCTAGAGGGCCCGTTTAAACCCGCTGATCAGCCTCGACTGTGCCTTCTAGTTGC 1664

New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections.

```
The invention relates to novel isolated polypeptides, mature forms of these, or a sequence that is at least 95 % identical to, or having one or more conservative amino acid substitutions in the polypeptides. The more conservative amino acid substitutions in the polypeptides. The polypeptides, nucleic acid molecules and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a conservative preferably a NOVX-associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, epilepsy, immune disorders (osteoarthritis), hematopoietic disorders, inflammatory skin disorders, asthma, and various dyslipidemias. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, call differentiation, call proliferation, call proliferation, call proliferation, changing and angiogenesis, in gene therapy, in the corresponds to the plant probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The nucleic acids are trither used as hybridization probes, in chromosome mapping, tissue corresponds to the gene encoing one of the NOVX polypeptides of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1606 crccascrcracaccccccrrraaacccccrcarcaccrccacrcrcrcracrrcracrracrracr

New isolated NOVX polypeptides and polymucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections

Claim 20; SEQ ID NO 23; 800pp; English

```
these, or a sequence that is at least 95 % identical to, or having one or more conservative amino acid substitutions in the polypeptides. The polypeptides, nucleic acid molecules and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a manufacture of a medicament for treating a syndrome associated with a molecules, polypeptides and antibodies are useful for treating, the manufacture of identication and iseases, preferably a NOVX-associated disorders, diabetes, preventing or diagnosing diseases such metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, epilepsy, immune disorders (osteoarthritis), hematopoietic disorders, inflammatory skin disorders, asshma, and various dyslipidemias. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or calcinate or calcinate or calcinate or thibit e.g. neurogenesis, calcinate and anglogenesis, in gene therapy, in the corresponds to the gene encoing one of the NOVX polypeptides of the

                                  replacement cells within a foetal non-human mammal, which comprises selectively destroying native cells in a tissue of a foetal non-human mammal host, where the number of maternal cells of the same tissue is not substantially reduced, and implanting foreign replacement cells in the tissue of the fetal non-human mammal host, where the foreign replacement cells replace destroyed cells of the tissue. The method is useful for facilitating growth and differentiation of foreign cells within a mammalian host, and for producing chimeric mammals that can be used to develop new drugs and vaccine, factors, drugs and tissues for transplantation, also useful to study human diseases. The present

The invention describes a new isolated polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful as therapeutics, polypeptide, nucleic acid and antibody are useful as theraticularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with NOVX polypeptide. The DNA encoding the protein is useful in gene therapy for treating the disease or condition. In particular, the NOVX polypeptide or polymucleotide is useful for treating endocrine/ metabolism-related disease (e.g. obesity or diabetes), central nervous system disorders (e.g. Alzheimer's disease, Parkinson's disease, cepilepsy, multiple sclerosis, schizophrenia or depression), autoimmune asthma, inflammatory bowel disease, rheumatoid arthritis or asthma, inflammatory bowel disease, rheumatoid arthritis or or torstate or brain cancers (e.g. colon, lung, liver, breast, ovarian, prostate or brain cancers (e.g. colon, lung, liver, breast, ovarian, cirrhosis), lung diseases (emphyema or obstructive pulmonary disease), haemophilia, stroke, or infections (e.g. viral, bacterial or parasitic). These are also useful in developing powerful assay system for functional applications, and for monitoring the effects of drugs during clinical applications, and for monitoring the effects of drugs during clinical trials. This sequence encodes a novel human NOV protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1656 CTGGAGTCTAGAGGGCCCGTTTAAACCCGCTGATCAGCCTCGACTGTGCCTTCTAGTTGC 1715

New cytoplasmic, nuclear membrane bound or secreted polypeptides (NOVX) and polynucleotides, useful in gene therapy, e.g. for treating or preventing obesity, multiple sclerosis, allergy, cancers, hemophilia, stroke or infections.

## Claim 20; Page 118-119; 586pp; English

The invention describes a new isolated polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful as therapeutics, particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with NOVX polypeptide. The DNA encoding the protein is useful in gene therapy for treating the disease or condition. In particular, the NOVX polypeptide or polymucleotide is useful for treating endocrine/ metabolism-related diseases (e.g. obesity or diabetes), central nervous system disorders (e.g. Alzheimer's disease, Parkinson's disease, epilepsy, multiple sclerosis, schizophrenia or depression), autoimmune and inflammatory disorders (e.g. posriasis, allergy, lupus erythematosus, asthma inflammatory bowel disease, rheumatoid arthritis or stemmatory bowel disease, rheumatoid arthritis or osteoarthrilis), cancers (e.g. colon, lung, liver, breast, ovarian, prostate or brain cancers, or melanoma), liver diseases (e.g. liver cirrhosis), lung diseases (emphysema or obstructive pulmonary disease), these are also useful in developing powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications, and for monitoring the effects of funge during clinical analysis of warming contains them as a contains and associated to the contains and associated to the contains and associated to the contains and contains the con This sequence encodes a novel human NOV protein

/clone_lib="Human Trabecular Meshwork cDNA library"
/clone_lib="trapecular Meshwork cDNA library"
cdNA library made from mRNA isolated from trabecular
meshwork cells established fom eyes from 6 individuals,
                                                    Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi; Mammalia; Butheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus. 1 (bases 1 to 23)

Fannon MR, Rosen CA; Dillon PJ, Barash SC, Choi GH, WPI; 1997-374922/35. Kunsch CA,

Polynucleotide(s) and proteins derived from Staphylococcus aureus -stored on computer readable medium and used in the production of anti-S.aureus vaccines.

Claim 1; Page 2287; 3271pp; English.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or

```
industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S. sureus infection. The polypeptides can also be used in a kit for the immunodetection of S. aureus in a sample. S. aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used (or recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the S. aureus DNA sequences contained on the computer
                                                                                                                                                                                                                                                                                                                                                                readable medium

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a B. coli strain J96 contig containing pathogenicity island (PAI) sequences, and represents a nucleic acid molecule of the invention. PAIS are large fragments of DNA which comprise pathogenicity determinants. The sequences of the invention are taken from PAI IV and PAI IV. PAI IV is located at approximately 64 min (near pheV) approximately 94 min (at pheR) on the B. coli chromosome and is greater than IVO kb. PAI V is located at approximately 94 min (at pheR) on the B. coli chromosome and is approximately 160 kb in size. Antibodies specific to the proteins encoded by the PAI open reading frames of the invention can be used in kits to detect uropathogenic B. coli. The proteins are used in vaccines to elicit a protective immune response in an animal to the uropathogenic B. coli
                                                                                                                       PAI; pathogenicity island; uropathogenic E. coli detection; PAI IV; pheR; PAI V; pheV; vaccine; protective immune response; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated uropathogenic E. coli nucleotide sequences - used to develop products for the detection of pathogenic E. coli and to elicit an immune response to pathogenic E. coli.
                                                                                                          9

               Sequence encodes beta-urogastrone under the control of a tac promoter. The peptide may be expressed from plasmid pUGT 150s in a transformed E.coli host. The plasmid may carry several separately expressing sequences comprising a tac promoter, SD site, signal peptide, and coding sequence, to produce beta-UG in high yield. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9

```

```
An example of a sequence detected by a probe consisting of polyinosine, polydeoxyinosine, oligoinosine and/or oligodeoxyinosine is labeled. The seDNA and probe are hybridized and the existence of DNA in the product is detected. It can be used to detect the presence of malignant tumour. (Updated on 10-MAR-2003 to add missing OS field.)                                                                                                                                                                                                                                                                                                                                                              The present invention relates to Drosophila cell cycle progression proteins (AAM47572-AAM47608) and their coding sequences (ABA90366-ABA90520). The coding sequences and proteins are useful for identifying a substance capable of affecting the function of the corresponding gene, a substance capable of inhibiting the cell division cycle, or capable of inhibiting the cell division cycle, or capable of inhibiting a tumour or proliferative disorder, cardiovascular disorders (such as restenosis and cardiomyopathy), autofimmune disorders such as (glomeralonephritis and rheumatoid arthritis), dermatological disorders (such as psoriasis), antiinflammatory, antifungal and antiparasitic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 AGGGTTATTGTCTCATGAGCGGATACATATTTGAATGTATTTAGAAAATAAACAAATAG
                                                                                                                                                                                                                                                                Polynucleotides encoding cell cycle progression proteins, useful for treating a tumor or a proliferative disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treponema pallidum infection; syphilis; Borrelia infection; animal; enzyme production; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polynucleotide sequence from the genome of Treponema pallidum

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The deriv. has various biological activities such as gastric acid secretion inhibiting action, or cell proliferation promoting action. The deriv. has the same biological or pharmacological activities as betaurogastrone. It is not susceptible to denaturation by oxidn. and is chemically stable. Deriv. has resistance to proteolytic enzymes such as protease. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence of HB101 (pGH201) encoding new beta-urogastrone deriv.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to Drosophila cell cycle progression proteins (AAM47572-AAM47608) and their coding sequences (ABM90366-ABM90520). The coding sequences and proteins are useful for identifying a substance capable of affecting the function of the corresponding gene, a substance capable of inhibiting the cell division cycle, or capable of inhibiting mitosis and/or melosis. They can also be used in a method for treating a tumour or proliferative disorder, cardiovascular disorders (such as restenosis and cardiomyopathy), autoimmune disorders such as (glomerulonephritis and rheumatoid arthritis), dermatological disorders

This invention relates to a novel method for the optimisation of primer libraries. Specifically, it refers to increasing the affinity of short boilgonucleocide primers also known as extendable oligos (EOs), for their template sequences. The present invention describes improved methods for sequencing and the linear and exponential amplification of DNA that can be useful for PCR, RT-PCR, ligation chain reaction (LCR), rolling circle amplification. Accordingly, these extendable oligos with improved specificity and affinity are particularly important in fields ranging from biotechnology and agriculture to medical research. This polynucleotide sequence is the electropherogram of a DNA sequencing reaction that used the pUCI9 plasmid and E154/T422 oligos, used in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 259 AGGGTTATTGTCTCATGAGCGGATACATATTTGAATGTATTTAGAAAATAAACAAATAG 318

The invention relates to novel isolated prostate gland related nucleic acids (1) and polypeptides (II). (1) and (II) are useful for diagnosis, prognosis, prevention, and/or treatment of diseases and/or disorders of the prostate such as acute non-bacterial prostatitis, chronic non-bacterial prostatitis, prostatodystonia, prostatosis, granulomatous prostatitis, malacoplakia, benign prostatic compressions, granulomatous prostatitis, malacoplakia, benign prostatic compactatophy or hyperplasia, and prostatitis, malacoplakia, benign prostatic dadenocarcinomas, transitional cell carcinomas, ductal carcinomas, and adenocarcinomas, transitional cell carcinomas, ductal carcinomas, and caquamous cell carcinomas. (1), (II) and antibody to (II) are useful for altanging reproductive system disorders (Paget's disease), cuthinis), blood-related disorders (sickle cell anaemia), archinish, blood-related disorders (sickle cell anaemia), hyperproliferative disorders, urinary system disorders

(glomerulonephritis), cardiovascular disorders (arrhythmias), respiratory disorders, musculoskeletal system disorders, neural activity and cutorine disorders (Alzheimer's disease and Parkinson's disease), confocrine disorders (Addison's disease and Parkinson's disease), conformine disorders (alsorders (biliary liver cirrhosis), concreatic and gall bladder disorders (biliary liver cirrhosis), concreatic and maintented disorders (diseases at the cellular level, and wound healing and epithelial cell proliferation. (I) or (II) and organs before transplantation, and as food additive or preservative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated prostate gland related polypeptide useful for diagnosis and treatment of disorders of prostate such as prostatodystonia, prostatosis, prostatitis, benign prostatic hypertrophy and malacoplakia

The invention relates to novel isolated polypeptides (I), and

C polynucleotides (II). (I) and the antibody to (I) are useful for

C diagnosting, preventing and treating diseases including immune system

C disorders (e.g. congenital and acquired immunodeficiencies, autoimmune

disorders (e.g. congenital and acquired immunodeficiencies, autoimmune

C disorders (e.g. rheumatoid arthritis), inflammatory conditions, organ

C (e.g. hepatitis C), bleeding disorders, haemoglobin abnormalities and

C charblood-related disorders (sickle cell anaemia), myeloproliferative

C disorders, primary haematopoietic disorders, hyperproliferative disorders

C disorders, primary haematopoietic disorders, chromosomal abnormalities

CC Alzheimer's disease, Parkinson's disease), chromosomal abnormalities

CC Alzheimer's disease, Parkinson's disease), chromosomal abnormalities

CC Alzheimer's disease, parkinson's disease), chromosomal abnormalities

CC Alzheimer's disease, parkinson's (e.g. stroke), renal disorders (e.g.

C plomerulorephritis), cardiovascular disorders (e.g. Arrythmia),

C respiratory disorders, dermatological disorders (e.g. Addison's

C disease), reproductive system disorders, in wound healing,

C disease), reproductive system disorders (cirrhosis), as stimulators of

C inflammatory disorders), liver disorders (cirrhosis), as stimulators of

C higher affinity antibodies, and as a means to induce tumour proliferation

C in pathologies e.g. acquired immune deficiency syndrome (AIDS). AAS26976-

/lab host="UserJourners | / Lab host="UserJourners | / Lab host="E. Coli strain XL10-Gold, T1-resistant, F-" / Clone lib="Oxytricha plasmid UUGCIO library" / Alone lib="Oxytricha plasmid UUGCIO library" / Alone Oxytricha trifallax was blunt end-repaired with DNA from Oxytricha trifallax was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. Vector DNA was prepared from a derivative of pwW42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. Coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
